## Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## Description

Cyborcs is a NFT game to earn CORC token, which is designed for players to provide exciting experiences by participating in virtual campaigning to receive the rewards in the game. In addition, Cyborcs allows players to train, improve, fix and level up their own characters

## Project Engagement

During the 8th of March 2022, **YoutubeToken Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

# Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

| Level                | Value   | Vulnerability   | Risk (Required Action)  |
|----------------------|---------|---|---|
| <b>Critical</b>      | 9 - 10  | A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.      | Immediate action to reduce risk level.                              |
| <b>High</b>          | 7 – 8.9 | A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way. | Implementation of corrective actions as soon as possible.           |
| <b>Medium</b>        | 4 – 6.9 | A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.                                     | Implementation of corrective actions in a certain period.           |
| <b>Low</b>           | 2 – 3.9 | A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.       | Implementation of certain corrective actions or accepting the risk. |
| <b>Informational</b> | 0 – 1.9 | A vulnerability that have informational character but is not effecting any of the code.   | An observation that does not determine a level of risk              |

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

## **Methodology**

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

-

# Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

*A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.*

## v1.0

# CallGraph v1.0

## Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Correct implementation of Token standard
2. Deployer cannot mint any new tokens
3. Deployer cannot burn or lock user funds
4. Deployer cannot pause the contract
5. Overall checkup (Smart Contract Security)

### Correct implementation of Token standard

| Function     | Description   | Exist | Tested | Verified |
|--------------|---|-------|--------|----------|
| TotalSupply  | provides information about the total token supply                           | ✓     | ✓      | ✓        |
| BalanceOf    | provides account balance of the owner's account                             | ✓     | ✓      | ✓        |
| Transfer     | executes transfers of a specified number of tokens to a specified address   | ✓     | ✓      | ✓        |
| TransferFrom | executes transfers of a specified number of tokens from a specified address | ✓     | ✓      | ✓        |
| Approve      | allow a spender to withdraw a set number of tokens from a specified account | ✓     | ✓      | ✓        |
| Allowance    | returns a set number of tokens from a spender to the owner                  | ✓     | ✓      | ✓        |

## Write functions of contract v1.0

# Source Units in Scope

## v1.0

| Type  | File                       | Logic Contracts | Interfaces | Lines     | nLines    | nSLOC     | Comment Lines | Complex. Score | Capabilities |
|---|----------------------------|-----------------|------------|-----------|-----------|-----------|---------------|----------------|--------------|
|  | contracts/youtubeToken.sol | 1               | ————       | 58        | 48        | 39        | 2             | 19             | ————         |
|  | <b>Totals</b>              | <b>1</b>        | ————       | <b>58</b> | <b>48</b> | <b>39</b> | <b>2</b>      | <b>19</b>      | ————         |

### Legend

| Attribute        | Description   |
|------------------|---|
| Lines            | total lines of the source unit  |
| nLines           | normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)   |
| nSLOC            | normalized source lines of code (only source-code lines; no comments, no blank lines)   |
| Comment Lines    | lines containing single or block comments   |
| Complexity Score | a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...) |

# Audit Results

# AUDIT PASSED

## Critical issues

**No critical issues**

## High issues

**No high issues**

## Medium issues

**No medium issues**

## Low issues

| Issue | File | Type                   | Line            | Description   |
|-------|------|------------------------|-----------------|---|
| #1    | Main | Pragma version missing | See description | <p>Provide a pragma solidity version at the top of source code. If you are choosing a pragma version above 0.8.x you have to add a SPDX License as well</p> <p>We have used 0.8.4 to be able to compile the contract and test it for vulnerabilities</p> <p>Make sure to use Safemath library and replace every raw math operations with safemath operations if you are going to use pragma version below 0.8.x</p> |

## Informational issues

| Issue | File | Type | Line | Description |
|-------|------|------|------|-------------|
|-------|------|------|------|-------------|

|    |      |  |            |  |
|----|------|--|------------|--|
| #1 | Main | State variables that could be declared constant (constable-states) | 5, 6, 7, 8 | Add the `constant` attributes to state variables that never change |
| #2 | Main | Name and symbol is not set   | 5, 6       | Modify your name and symbol in your contract                       |
| #3 | Main | Require error message is missing                                   | 29, 50, 51 | Provide an error message to the require statement                  |

## Audit Comments

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <https://docs.soliditylang.org/en/v0.5.10/natspec-format.html>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

The logo features the words "SolidProof" in a white, handwritten-style script. The "P" is large and stylized, with a long horizontal stroke that extends to the left. The background is a solid blue color with a faint, large shield emblem. The shield has a grid-like pattern on its right side and a solid blue area on its left side.
